Living With Nasal Polyps: The Next Step Forward

“With nasal polyps, I feel like my nose is always running.”
Many people live with the symptoms of nasal polyps, known as chronic rhinosinusitis with nasal polyposis (CRSwNP)—and have accepted their constant runny nose, nasal congestion, facial pain, and loss of smell as “just the way it is.”

And many—like you—may have experienced this condition for years. But if your nasal polyp symptoms are messy and bothersome, and they interfere with your daily activities, it’s important to know that science is advancing what we know about nasal polyps.
A different kind of inflammation

Research in nasal polyp science confirms that a specific kind of inflammation inside your body can be associated with nasal polyps. It’s called type 2 inflammation, and it can also be associated with other inflammatory diseases, including asthma and eczema (atopic dermatitis).

Current solutions, such as nasal sprays, steroids, and surgery can be effective. However, they don’t always provide lasting relief, because they don’t target the underlying type 2 inflammation associated with nasal polyps. And more than half of those who do have surgery may experience nasal polyp regrowth—and a return of their symptoms.
